INTRODUCTION AND EXECUTIVE SUMMARY

INTRODUCTION

This report provides a general description of trends and variations in poverty in Ohio. Four sections follow this introduction and executive summary. The first shows how poverty rates in Ohio have changed over time, and compares them with rates for the nation. Comparisons and variations with contemporary unemployment rates and inflation-adjusted per capita income are discussed. The second notes variation between counties and other kinds of geographic areas. The third shows variations and trends in poverty rates by social circumstances and personal characteristics such as employment history, public assistance, education, household and family type, age, race, sex and Hispanic status. The fourth is an appendix with detailed tables and discussions of the measurement of poverty. The graphs and many of the discussions herein are based on, and refer to, the Appendix Tables.

Statistics used in this report come from the U.S. Census Bureau – specifically the 2000 decennial census, the Current Population Survey, the American Community Survey (the successor to the 2000 Census long form social and economic survey questions), and the Small Area Income and Poverty Estimates program. Other sources include the Ohio Department of Job and Family Services' Labor Market Information division for annual unemployment rates, the U.S. Bureau of Economic Analysis for per capita income, and the U.S. Bureau of Labor Statistics for consumer price index data.

Clients of the Ohio Development Service Agency's Research Office frequently request detailed and current information about poverty and the near poor in Ohio. Clients include governmental organizations such as the Departments of Aging, Health, Job and Family Services, Youth Services, other agencies in Development, the Legislative Services Commission and local governments as well as private sector advocacy organizations and the general public. All of them desire information regarding eligibility for programs such as Medicaid, Children's Health Insurance, and Head Start, among others, and Census Bureau data on poverty and the near poor help answer their questions. This report covers changes from 1959 through 2016, although the more in-depth sections focus on 1999 and selected later years.

EXECUTIVE SUMMARY

- The latest annual data show:
 - An estimated 1,645,000 people in Ohio were poor – that was 14.6 percent of all persons for whom poverty status was determined, and a poverty rate slightly greater than the national rate of 14.0 percent.
 - An estimated 307,000, or 10.5 percent, of Ohio families were poor; the corresponding U.S. rate was 10.0 percent (family poverty rates are lower because family members share resources, and not all persons are in families).
- The latest American Community Survey data for sub-state areas show:
 - 46 of Ohio's 88 counties had poverty rates below the national average of 15.1 percent; 42 were at or above the average (averages based on the 2012-2016 five-year dataset).
 - 17.6 percent of the people in Appalachian Ohio, a band of 32 counties stretching across the eastern and southern regions of the state, were poor; the poverty rate for the rest of Ohio averaged 14.9 percent (five-year averages).
 - Delaware, Warren, Medina and Geauga had the lowest poverty rates, ranging from 4.5 to 6.9 percent – all are sub-urban metropolitan area counties; Athens, Adams, Scioto, Jackson and Meigs had the highest poverty rates, ranging from 31.2 to 22.8 percent – all are Appalachian (five-year averages).
 - 15.9 percent of the people in urban places (densely populated areas of 2,500 or more) were poor, compared with 9.8 percent in rural areas (farms and smaller places); within urban areas, 25.8 percent of those living in the central or principal cities of metropolitan areas were poor, while 12.0 percent of residents of other urban areas were poor (drawn from the 2015-2016 state-wide summaries for area types.)
 - 15 cities, including nine metropolitan area central cities and four small college towns, had poverty rates at or above Ohio's metropolitan-area-central-city average of 27.2 percent (five-year averages).
- Poverty rates for families and individuals in Ohio during 2015-2016 vary by circumstances and characteristics:
 - Married couples with a full-time/year-round worker had poverty rates under 5.0 percent (2.0 percent or less if the other worked) compared with poverty rates over 9.0 percent among couples lacking a full-time/year-round worker.
 - Other families with a full-time/year-round head had poverty rates between five and 11 percent, while those without one had poverty rates greater than 29 percent.

- Families with related children had poverty rates ranging from 6.0 percent among married couples to 41.1 percent for those headed by a female single-parent; the corresponding poverty rates for families without children ranged from 3.2 percent to 11.5 percent; male single-parent families had poverty rates between the corresponding end-points.
- 24.1 percent of poor families received cash public assistance, compared with 6.3 percent of families not in poverty; however, such payments seldom boost families out of poverty.
- Only 3.8 percent of adults with at least bachelor's degrees were poor, while 27.2 percent of those who did not graduate from high school were poor; 13.5 percent of those with just a high school diploma or GED were poor, and 11.2 percent of those with some college or an associate's degree were poor.
- Children ages 0 to 11 years and young adults ages 18 to 24 years had poverty rates exceeding 21 percent; other working-age adults had poverty rates between 10 and 16 percent.
- 8.1 percent of people ages 65 years and older were poor, but 54.2 percent of them would have been poor without social security.
- 11.2 percent of non-Hispanic whites and 15.3 percent of Asians/Pacific Islanders were poor; poverty rates for other races and Hispanics (who may be of any race) ranged between 24 and 31 percent.
- 62.8 percent of minority poverty was located in the central or principal cities of metropolitan areas, while 52.5 percent of non-Hispanic poor whites lived in other urban places.
- Women ages 18 to 34 years have much higher poverty rates than men of comparable ages; the difference essentially disappears in late middle age (55 to 64 years), only to reappear in old age (65 years and over).
- An alternative poverty measure estimated Ohio's poverty rate at 11.8 percent for the 2014-2016 period after adjusting for clothing, shelter, utilities and out-of-pocket medical expenses, living arrangements, regional cost-of-living variations, and non-cash and tax benefits; this is less than Ohio's official rate of 14.3 percent as well as lower than the corresponding alternative and official national rates for the same period.

OHIO'S POVERTY RATE HISTORY, WITH COMPARISONS TO THE U.S.

POVERTY RATE TRENDS AMONG INDIVIDUALS

The latest American Community Survey data show that an estimated 1,645,000 people in Ohio were poor during 2015-2016.¹ This figure is 14.6 percent of the 11,287,000 persons for whom poverty status was determined. Both the number and percentage of poor people in Ohio are lower than the 1,846,000 and 16.4 percent seen in 2010-2011, but remain above the 1999 decennial census figures of 1,171,000 and 10.6 percent.

The graph above illustrates variations in Ohio's poverty rate since 1959, and data in Appendix Table A1 chronicle annual estimates beginning in 1969. The poverty rate fell from 15.9 percent to 10.0 percent by the end of the 1960s, and continued diminishing to 8.2 percent in 1974. The poverty rate rose thereafter to 13.3 percent in 1983 and 1984. It fluctuated around 13 percent for the next decade before falling to 10.6 percent in 1999. Ohio's poverty rate after the turn of the century rose almost without interruption from 11.9 to 16.4 percent before gradually decreasing to 14.6 percent.²

The graph above and data in Appendix Table A1 also show a gradual convergence of Ohio's poverty rate with that of the nation, which was substantially higher decades ago. The greatest convergence occurred in the 1960s when the gap fell from 6.2 percent (22.1 for the nation vs. 15.9 for Ohio) in 1959 to 3.7 percent (13.7 vs. 10.0, respectively) in 1969. The gap closed to 2.1 percent by 1979, and to 1.0 percent or less in the late 1980s. It widened to nearly 2.0 percent for most of the 1990s only to close after the turn of the century. Ohio's poverty rate is now roughly the same as the national rate. The two poverty rates and their changes over the years almost always tracked one another in the direction, if not the magnitude of change, implying that changes in Ohio are more or less part of changes across the nation.

■ U.S.

Notes: * - CPS; ^ - decennial census; hyphenated - ACS

POVERTY RATE TRENDS AMONG FAMILIES

The latest American Community Survey data also show that about 307,000 families in Ohio were poor during 2015-2016. That figure represents 10.5 percent of approximately 2,930,000 families in the state. Both the number and percentage of poor families here are lower than the 350,000 and 12.0 percent seen in 2010-2011, but remain above the 1999 decennial census figures of 251,000 and 8.3 percent.

The graph above illustrates variations in Ohio's family poverty rate since 1959, and data in Appendix Table A2 chronicle annual estimates beginning in 1969. Ohio's family poverty rate fell from 13.2 to 7.6 percent during the 1960s, and continued falling to 6.6 percent by 1974. It rose to 10.7 percent by 1982, and stayed above 10 percent for all but two years of the following decade. It peaked at 11.2 percent in 1993 before falling to 8.2 percent in 2000, the lowest level since 1979. Ohio's family poverty rate rose to 12.0 percent in 2010-2012 before declining to 10.5 percent in 2015-2016.

The graph above and data in Appendix Table A2 also show a gradual convergence between the state and national family poverty rates. The greatest convergence occurred in the 1960s when the gap fell from 5.2 percent (18.4 vs. 13.2) in 1959 to 3.1 percent in 1969. The gap closed to 1.6 percent by 1979 and to less than 1.0 in the late 1980s. It widened a bit for most of the 1990s, only to close after the turn of the century. Except for the 2008-2010 period when Ohio's family poverty rate appeared slightly greater than the national rate, it has been nearly indistinguishable from national rate since. The two poverty rates and their changes over the years almost always tracked one another in the direction, if not the magnitude of change, again consistent with the idea that changes in Ohio are part of the changes across the country.

Changes over time in individual and family poverty rates nearly parallel one another because most people live in families. Family poverty rates are lower than poverty rates for individuals because people not in families are assumed not to share their resources – ultimately income(s).³

Note: ^ - poverty rate from decennial census

THE RELATION OF OHIO'S POVERTY RATE WITH SELECTED ECONOMIC VARIABLES

The graph above illustrates changes in the poverty rate for persons, the unemployment rate and per capita income (PCI, adjusted for inflation and standardized on 2015-2016) since 1959, and data in Appendix Table A3 show annual figures beginning in 1969. PCI is the broadest measure of income in a society, and because poverty is defined as insufficient income, it seems reasonable to expect that the poverty rate would decline as PCI increases and rise as PCI declines. The tabular data and graph show that there have been times when this appears to be true: the net change from 1959 to 1969, when PCI (green columns) rose from approximately \$18,600 to \$24,900 and the poverty rate (black dots) fell from 15.9 to 10.0 percent; also 1970-1973, 1992-1999, and even 2011-2016. Conversely, PCI fell and poverty rates rose during 1974-1975, 1979-1980 and 2007-2010. Yet there are times when the poverty rate and PCI did not move in opposite directions, but rose or fell together: 1969-1970, 1975-1978, 1991-1993, and 1999-2008. Over the long term, though, PCI more than doubled from 1959 to 2016 (from \$18,700 to \$44,400), while the poverty rate repeatedly fell and rose within the range of 8.2 to 16.4 percent.

Similarly, it seems reasonable that poverty and unemployment rates would move in opposite directions because jobs are the major source of income. There times when this has been seen: 1971-1975, 1978-1982, 1993-2004, 2006-2010, and 2011-2016; sometimes changes in the poverty rate appear to lag changes in the unemployment rate by a year – see 1992-1993 and 2010-2012. Again, though, there are times when the inverse relationship does not appear to hold: 1969-1971, 1975-1978, 1982-1992 and 2004-2006.

The at-best intermittent association of changes in poverty rates with changes in unemployment rates and PCI suggests that other factors not incorporated here may come into play and/or the nature of the associations may be more complex than some people might initially think. Regarding the latter, it should be remembered that for most people poverty is defined in a family context, while PCI and unemployment refer to individuals. There are lots of possible combinations of a husband and wife (the most common type of family) and their labor force status – not in the labor force, unemployed, employed (full time or part time) – any change in which may or may not impact the family's poverty status. For example, a husband losing his job will, all other things being equal, increase the unemployment rate (assuming he still looks for work) and decrease the family income. However, it may not put his family into poverty, perhaps depending on how long he is out of work, how much his wife works, her income level, and any unemployment compensation received. Conversely, a husband's new job will reduce the unemployment rate and increase the family income, but it may not pull his family out of poverty – also depending on whether it is a full- or part-time job and how much income is earned. Non-economic factors also may play a role in the risk of poverty. Further complicating matters are segments of the population not in the labor force: children and retirees. These and other factors are discussed in the Circumstances section.

COUNTIES 2012-2016

The map above shows the variation in poverty rates across Ohio during the 2012-16 period according to the latest American Community Survey dataset.⁴ The rates ranged from 4.9 percent in Delaware to 31.2 percent in Athens.⁵ Altogether, 10 counties had poverty rates less than 10 percent, 38 had rates ranging from 10 to 15.2 percent (less than the state poverty rate for this period), 28 counties had rates above the state average but less than 20 percent, and 12 counties had rates greater than 20 percent. The median county poverty rate in the state was 14.35 percent; 44 counties were below that mark and 44 were above it.

Some types of areas had poverty rates higher than other types. Most notably, the 32-county Appalachian area, outlined above, had a poverty rate of 17.6 percent – 342,500 of its 1,951,000 people in Ohio. Although poverty rates among Appalachian counties range from 10.5 to 31.2 percent, 11 of the 12 counties with poverty rates above 20.0 percent were Appalachian. The poverty rates for counties in the remainder of Ohio ranged from 4.9 to 20.7 percent, with an area average of 14.9 percent – about 1,390,000 people out of 9,316,000.

A closer look at the map above also reveals relatively high poverty rates in most of the counties with metropolitan area central cities. Allen (Lima), Clark (Springfield), Cuyahoga (Cleveland-Elyria), Franklin (Columbus), Hamilton (Cincinnati), Jefferson (Steubenville), Lucas (Toledo), Mahoning (Youngstown), Montgomery (Dayton), Richland (Mansfield) and Trumbull (Warren) had poverty rates higher than the state average of 15.4 percent. Stark (Canton-Massillon) and Summit (Akron) were the exceptions. The 13 counties collectively had 1,030,000 poor out of nearly 5,902,000 people for whom poverty status was determined – a poverty rate of 17.5 percent. The 1,030,000 also comprised 59.4 percent of all poor people in Ohio; by comparison, the 13 counties have 52.4 percent of Ohioan for whom poverty status was determined.

The data in Appendix Table A4 show that the poverty rate for the state was significantly higher in 2007-2011 when compared with 1999: 14.8 vs. 10.6 percent, with the rise evident for 72 of the 88 counties. The 15.4 percent state poverty rate for 2012-2016 was, in turn, significantly higher than that for 2007-2011 period, but seemingly clear increases were discernable in only seven counties, and the poverty rate for one county (Champaign) appeared to fall.⁶

See Table A4

Ranges of SAIPE County Poverty Rates in Ohio, 2001-2016 Plus Ohio and U.S. Rates

Source: U.S. Bureau of the Census

ANNUAL SAIPE ESTIMATES FOR COUNTIES

In contrast to the sample-based five-year county averages in the preceding section, the Census Bureau publishes annual model-based estimates of poverty numbers and rates in its Small Area Income and Poverty Estimates (SAIPE) program for data users who need such figures. The graph above illustrates the range of the such county poverty rates, with the lowest to highest noted above and below the vertical black lines. The complete list for counties is in Appendix Table A5a. Summary percentages for the state (red) and the nation (blue) are included for comparison. The black boxes illustrate the gap when Ohio's poverty rate was below the national average, the white boxes when it had an above-average rate, and the bars when the rates were nearly identical. The ranges shown above became wider – and the gap between Ohio and the U.S. narrower – with incorporation of American Community Survey data beginning in 2005. The estimated numbers for 2006-2016 are in Appendix Table A5b.⁷

See Tables A5a and A5b

Changing Poverty Rates in Ohio's 10 Largest Cities 1999, 2007-2011 and 2012-2016

Source: U.S. Census Bureau

■ 1999

■ 2007-11

■ 2012-16

Note: * - A metropolitan area central city.

OTHER TYPES OF AREAS 2012-2016

The chart above shows how poverty rates in Ohio's 10 largest cities have changed since 1999: all were significantly higher in 2007-2011 than in 1999. However, significant increases from 2007-2011 to 2012-2016 were seen in just four cities: Cincinnati, Cleveland, Toledo and Youngstown. Changes in the remaining cities – whether increases or decreases – cannot be measured with the same degree of confidence, and may reflect sampling variability differences more than the four. (See Appendix Table A6.) Collectively, the 10 cities have 20.8 percent of all Ohioans for whom poverty status was determined in 2012-2016, and 36.5 percent of all Ohioans in poverty. It also is noteworthy that nine of the 10 cities have higher poverty rates than the counties in which they are located; Parma (in Cuyahoga) is the sole exception.

The central and principal cities of metropolitan areas (i.e., the largest cities for which the metropolitan areas are named) collectively had a higher poverty rate than metropolitan residents not in principal cities: 27.2 vs. 10.7 percent. Both are significantly higher than the corresponding rates of 25.6 and 10.0 during 2007-2011 and 18.9 and 6.5 percent in 1999. The American Community Survey (ACS) and decennial census (DC) data summarize poverty statistics for other types of areas within Ohio. Data in Appendix Table A6 show the poverty rate in urban areas (densely populated areas of at least 2,500 people) was estimated at 16.8 percent, higher than the 16.4 rate in 2007-2011 and the 11.5 rate in 1999; the poverty rate for rural areas was estimated at 10.5 percent, also higher than the 9.8 rate in 2007-2011 and the 7.6 rate in 1999. (Rural areas include people living on farms as well as densely populated areas of less than 2,500 people.) All of these summary percentage increases from 1999 to 2007-2011 and 2012-2016 appear to be statistically significant. However, caution is warranted for such conclusions.⁸

The summary rise in the urban poverty rate is the aggregation of many local components. ACS and DC data for the 86 cities in Ohio with at least 20,000 people (a subset of all urban residents) show that 75 experienced significant increases in poverty rates from 1999 to 2007-2011, but only 13 saw poverty rates climb further during 2012-2016, while two appear to have lower rates than in 2007-2011: Marion and Mason. Beyond these summary statements, the experiences of cities varied widely. Eleven cities had poverty rates exceeding 30 percent in 2012-16: Athens, Bowling Green, Canton, Cleveland, Dayton, Kent, Oxford, Portsmouth, Warren, Youngstown and Zanesville; the increased poverty rates since 1999 were significant for all but Athens and Oxford.⁹ Twelve cities appeared at the other end of the spectrum with poverty rates below five percent: Avon, Avon Lake, Beavercreek, Dublin, Hilliard, Hudson, Mason, North Ridgeville, Rocky River, Solon, Strongsville and Westlake; all are suburbs in the metropolitan areas of Akron, Cincinnati, Cleveland, Columbus and Dayton. See Appendix Table A6 for data for all 86 cities.

See Table A6

Poor and Near-Poor Persons in Ohio: **The Ratio of Income to Poverty Level** **for 11,267,500 Persons, 2012-16**

Source: U.S. Census Bureau

THE POOR AND THE NEAR-POOR: COUNTY VARIATIONS

In addition to the number and percentage of poor people, there are programmatic needs to know the number and percentage of people who are more or less close to being poor. The chart above illustrates the progressively cumulating figures of Ohioans for whom poverty status was determined who were poor or relatively close to poverty. The left-most column shows the number poor persons (i.e., those whose income was less than 100 percent of the ratio of their income to their poverty level) was estimated to be about 1,732,800 during 2012-2016. That figure was 15.4 percent of the 11,267,500 people for whom poverty status was determined. The right-most column shows about 3,750,300 people had incomes less than 200 percent of the poverty level; that was 33.3 percent of the total. The latter figures include the 1,732,800 who were poor and about 2,017,500 – 17.9 percent – more who were not poor, but were more or less close to being poor. The middle four columns show numbers and percentage of Ohioans in other commonly used categories: below 125, 150, 175 and 185 percent of the ratio of income to the poverty level. The percentages shown above all are within 0.4 percent of the corresponding national averages. (See Appendix Table A7a).

As with county poverty rates, the variation of poverty-and-near-poverty rates within Ohio was notable. Appendix Table A7a shows Delaware County had the lowest percentage of those under 200 percent of the poverty level – 12.9 – while Adams County had the highest such percentage – 51.8. Altogether, 18 counties had poverty-and-near-poverty rates of at least 40 percent, 46 counties had rates in the 30s, 21 counties had rates in the 20s, and three counties had rates less than 20 percent; Medina and Warren were the other two. Appalachian counties collectively had 38.3 percent below 200 percent of the poverty level. The corresponding rate for non-Appalachian counties was 32.2 percent. Appendix Table A7a also shows by county the numbers and percentages of persons below other poverty-and-near-poverty levels of 125, 150, 175 and 185 percent.¹⁰

See Table A7a

Poor and Near-Poor Persons by Area Type: **The Percentages of Persons Under Selected** **Ratios of Income to Poverty Level, 2012-16**

Source: U.S. Census Bureau

THE POOR AND THE NEAR-POOR: VARIATIONS BY AREA TYPES

The chart above illustrates variations in poverty and near-poverty rates by the area types in which Ohioans live. An average of 15.4 percent of all Ohioans (gray column in the left set) were poor during 2012-2016; up to 33.3 percent were poor or near-poor (gray column in the right set). Poverty and near-poverty rates were noticeably lower in rural areas (green columns) – about five or six percentage points lower than the corresponding state averages at every level, and slightly higher than the state averages in urban areas (light blue columns with the red dots) – about two or three points above the state averages. (The different degrees of departure for the overall averages reflect the fact 77.8 percent of Ohioans live in urban areas).

The chart above also subdivides urban areas into summaries for metropolitan area central and principal cities (dark blue columns) and all other urban areas (white columns with red dots). It shows the highest poverty and near-poverty rates generally are found in the former – rates range from 27.2 to 49.4 percent; the latter have rates between the state and rural averages, ranging from 12.6 to 29.0 percent.

Despite these general tendencies, a wide range of variability is evident among individual places. Data in Appendix Table A7b lists poverty and near-poverty rates for the 86 cities with at least 20,000 people. Dublin, Hudson and Mason had the lowest percentages of people under 200 percent of the income-to-poverty-level ratio – all less than 10 percent. 18 cities ranged from 10 to 19.6 percent of the same poor and near-poor category, 16 ranged between 20 and 29.9 percent of their population, 11 were in the 30 to 39.9 percent range, 20 were in the 40 to 49.9 percent range, and 18 ranged from 50 to 66.4 percent of their populations under that ratio. Of the 16 metropolitan area central and principal cities in Ohio, only Mentor was below the state average with 15.8 percent of its poverty-status-determined population below 200 percent of the income-to-poverty-level ratio.

THE CIRCUMSTANCES OF POVERTY: VARIATIONS AND TRENDS IN OHIO

2015-2016 Ohio Poverty Rates by Family Type and Householder's Work Status All Families vs. Families without Social Security and Pensions

Source: U.S. Census Bureau

EMPLOYMENT STATUS, FAMILY TYPE AND THE WORKING-AGE COHORT

There are two points to be made about employment status and the risk of poverty. The graph above illustrates the first point: there is nothing like a full-time/year-round (FT/YR) job for minimizing the risk of poverty. The overall family poverty rate in Ohio was 10.5 percent in 2015-2016. The column at far left shows the overall poverty rate was 3.0 percent when the householder worked full-time/year-round (FT/YR – green column). This contrasts with a 20.7 percent poverty rate for householders working less than full-time/year-round (Not FT/YR – the light blue column). (Householders may be male or female, but the Census Bureau’s tabular data make no distinction by sex among married couples.)

Poverty rates varied with different types of families of FT/YR workers (green columns, left set): 1.0 percent among married couples (MC), 5.1 percent among male-householders-no-wife-present (MH-NWP) and 10.2 percent among female-householders-with-no-husband-present (FH-NHP). These contrast with the poverty rates when the householders worked less than FT/YR (blue columns, left set): 6.8 percent for married couples, 29.9 percent among male-householders-no-wife-present and 54.5 percent among female-householders-no-husband-present. Appendix Table A8a presents corresponding data for 2008-2009 (from the 2010 American Community Survey) and 1999 (from the 2000 decennial census).

The family poverty rates when the householder did not work (DNW, red columns, left set) are relatively close to the corresponding rates for householders not FT/YR: 16.9 vs. 20.7 percent overall, 8.6 vs. 6.8 percent among married couples, 33.5 vs. 29.9 percent among male-head-no-wife families, and 41.1 vs. 54.5 percent among female-head-no-husband families. This curious set of facts suggests that the relationship between work and family poverty may be more complex than simple summaries can reveal, and that other factors may be involved.

The relationship between the extent of employment and the risk of poverty for families is clarified in the set of columns of the right by *excluding the 946,000 families receiving social security and/or retirement pensions – essentially retirees*, which leaves the working-age cohort. The contrasts between FT/YR and not FT/YR employment in this subset are roughly the same magnitudes as among all families: poverty rates of 3.2 vs. 27.3 percent overall, with married couples experiencing 1.1 vs. 9.1 percent, male-head-no-wife families at 4.2 vs. 36.6 percent and female-head-no-wife families at 10.8 vs. 60.4 percent. However, family poverty rates are much higher when the head did not work *and* the family had no social security or pension income. The overall rate among these jobless (red columns, right set), which excludes retirees, was 44.2 percent, with married couples now at 22.4 percent, male-head-no-wife families at 73.4 percent and female-head-no-husband families at 77.5 percent. These figures indicate the profound impact of under- and unemployment for this segment of society (See Appendix Table 8b).

See Tables A8a & A8b

2015-2016 Ohio Poverty Rates Among Married Couples by the Work Status of Both

All Couples vs. Couples without Social Security and Pensions

Source: U.S. Census Bureau

EMPLOYMENT STATUS, MARRIED COUPLES AND THE WORKING-AGE COHORT

The preceding section showed that married couples had the lowest family poverty rates for every level of householder employment. A substantial contributing factor is illustrated in the graph above and leads to the second point about employment and poverty: being married to someone working full-time/year-round (FT/YR) also reduces the risk of poverty. Among all married-couple families (the left set of columns) it is at-worst about 4.5 percent (light green columns). The risk of poverty was reduced to 2.0 percent or less when one worked FT/YR and the other worked part-time (Not FT/YR, dark green columns), and the risk of poverty nearly vanishes if both work FT/YR (the gold column). These poverty rates contrast with those for couples lacking a FT/YR job (the blue columns). Poverty rates for the latter ranged between nine and 14 percent, depending on whether one (dark blue column) or both (light blue columns) had a part-time job. Appendix Table A8a has comparable figures for 2008-2009 and 1999; the poverty rates seen then for married couples in corresponding circumstances varied little from those shown above.

The chart above also shows an anomalously low poverty rate of 9.6 percent among all couples when neither worked (red column). As in the preceding section, *excluding the 761,000 couples receiving social security and/or pension incomes and focusing on the working-age cohort* clarifies the relationship between the extent of employment and their families' risk of poverty. Poverty rates are still relatively low – 7.7 percent at-worst – when at least one has FT/YR employment: specifically, compare the gold and green columns on the right with those on the left. On the other hand, poverty rates are much higher when FT/YR employment is absent, ranging from 36.8 to 72.4 percent (dark blue and red columns on the right). Excluding retired couples shows the profound effect of under- and unemployment on couples who actually need jobs (see Appendix Table 8b).

However, it needs to be noted that despite the generally lower poverty rates for married couple families, marriage is not always a solution to poverty and associated problems, particularly for female-head-no-husband-present families.

“The flaw in the argument is the assumption that all marriages are equally beneficial. In fact, however, the pool of potential marriage partners for single mothers in impoverished communities does not include many men with good prospects for becoming stable and helpful partners. Single mothers are especially likely to marry men who have children from other partnerships, who have few economic resources, who lack a high-school diploma, or who have been incarcerated or have substance abuse problems” (Williams, 2014).

Such relationships tend to be of low quality, and are likely to end in divorce, subsequently leaving the women even worse off (cited by Williams, 2014).

Notes: * - ACS estimates cover January of the prior year through November the listed year.

^ - Actually the poverty status of the householder.

HOUSEHOLD TYPE AND THE PRESENCE OF RELATED CHILDREN

The risk of poverty varies not only by the type of household in which people live, but by the presence or absence of children, too. The chart above shows that regardless of family type – married couple, male- or female-headed – families with at least one child have a greater risk of poverty than families with no children. It also shows that female-headed families have the greatest risk of poverty, while married couples have the lowest risk. One factor contributing to the higher poverty rates of female-headed households is the generally lower incomes women earn.¹¹

While the various types of households with children experience greater poverty rates than corresponding households with no children, it is difficult to argue that children cause poverty because other factors may come to bear. The oldest children may be employed and contributing to the family's income, and mothers – the principal caretakers of children – are more likely to earn an income if all of their children are in school than are mothers with pre-school children.¹² Both events increase the family's income. In addition, older people (to a point in late middle age) generally have higher earnings than younger people do.¹³ Nevertheless – all other things being equal or unchanged – adding a child increases the family size and income threshold for poverty, with the possible consequence that the family income may no longer be adequate to keep the family out of poverty.

The poverty rates for non-family households are similar to those of male-headed families with children, and show the same pattern of a lower risk in 1999 than in 2008-2009 or 2015-2016.¹⁴

The chart above also shows the variation in poverty rates over time. Poverty rates were lower in 1999 than in 2008-2009 and 2015-2016.

Note: * - ACS figures cover January of the prior year through November of the listed year.

CASH PUBLIC ASSISTANCE

About 238,500, or 8.1 percent, of all families in Ohio received some form of cash public assistance (CPA) at some time in the preceding 12 months according to the latest data from the American Community Survey.¹⁵ This is slightly greater than the 7.5 and 6.5 percent rates of 2008-2009 and 1999 (see Appendix Table 10). (Non-cash forms of assistance have been excluded. However, the impact of the latter in reducing poverty is evident in Fox (2017: Figure 2 & Appendix Tables A-6 & A-7).)

The chart above shows poor families (red columns) uniformly are much more likely to receive CPA than are families at and above the poverty level (green columns), but not all poor families receive CPA. Poor families may not have received CPA because they did not apply for it or did not meet all of the eligibility requirements. The percentage of all *poor* families receiving CPA (left-most of the red columns) was higher in the past, dropping from 29.4 percent in 1999 to 24.6 in 2008-2009 and 24.1 in 2015-2016. On the other hand, less than seven percent of all families *at or above* the poverty level (left-most of the green columns) received CPA in the year preceding the data collection. Families that are near poverty may receive CPA because eligibility may be cut-off above the poverty level, because members may have worked part of the 12 preceding months, or because they were poor and receiving CPA prior to resuming work.

These percentages also vary by family type. Among those *not* in poverty, less than five percent of married couples received CPA during the years shown; at the other end of the spectrum families headed by women with no husband present ranged from 10.9 to 14.6 percent. Still all of these percentages are less than those for *poor* families. Among the latter, those headed by women with no husband present had the highest CPA rates – between 27 and 28 percent in 2008-2009 and 2015-2016, down from 36 percent in 1999. These contrast with the rates for families headed by men with no wife present, which showed relatively small net changes between the years, and married couples, which fluctuated between 18 and 21 percent.

Finally, it is worth noting CPA boosts or keeps only a fraction of families out of poverty. About 238,500 families received CPA in 2015-2016, but CPA relieved the poverty of only 29,500-plus. For the rest, CPA either was insufficient for relieving poverty or was not critical for staying out of poverty (U.S. Bureau of the Census – ACS, 2017b). Figures for 2008-2009 were about 223,000 receiving CPA, with 24,800 boosted out of poverty (U.S. Bureau of the Census – ACS, 2010b); figures for 1999 were about 197,000 receiving CPA and 19,500 boosted out of poverty (U.S. Bureau of the Census – DC, 2003). (The same data sources estimated family poverty numbers and rates at about 305,500 and 10.4 percent in 2015-2016, 348,000 and 11.7 percent in 2008-2009, and 235,000 and 7.8 percent in 1999.)

See Table A10

Poverty Rates in Ohio by Educational Attainment Among Persons Age 25 Years and Older, 1999-2016

	Not a High School Graduate	High School Graduate or GED	Some College or Associate's Degree	Bachelor's Degree and/or Post Graduate Work
2016 ACS*	27.2%	13.5%	11.2%	3.8%
2009 ACS*	26.4%	12.6%	10.4%	3.8%
1999	18.8%	7.8%	5.5%	2.7%

Source: U.S. Census Bureau.

Note: * - ACS data cover January of the prior year through November of the listed year.

EDUCATIONAL ATTAINMENT

The skills and knowledge acquired with greater educational attainment tend to be less common and in greater demand. Consequently, employment is steadier and earnings typically are higher. In this sense, greater educational attainment generally indicates the ability to earn more money over the years. Therefore, it is not surprising that the risk of poverty falls with more education. The chart above shows that poverty rates are highest among those without a high school education and lowest among those with a bachelor's degree or more. Getting a high school diploma reduces the risk of poverty more than subsequent educational attainment. Nevertheless, some college or an associate's degree reduces the risk further, and a bachelor's degree or post-graduate work reduces it even more.

However, even among the most highly-educated, poverty rates fluctuate over time. American Community Survey data show the highest poverty rates across all educational levels in 2015-2016, while poverty rates generally were slightly lower in 2008-2009 and much lower for each level in 1999.

See Table A11

Poverty Rates in Ohio by Age Groups for Selected Years, 1999-2016

Source: U.S. Census Bureau.

Note: * - ACS data cover from January of the prior year though November of the listed year.

AGE GROUPS, OVERALL

The risk of poverty varies by age group, and the differences charted above may be best understood as part of life-cycle changes. As mentioned earlier, the addition of a child may tip a family into poverty. Sooner or later, though, children enroll in school and become more capable of caring for themselves. These changes eventually enable more adults to orient their activities more towards earning an income, and it is not uncommon for teenagers to earn money with part-time jobs. (However, the income of children under 15 is excluded from family income calculations.) Consequently, as the chart above illustrates, the poverty rates for children decline as they grow older.

The risk of poverty is greater for 18-to-24-year-olds than for most other age groups for several reasons. Young adults often are living independently for the first time. They often are unmarried, have low-paying or part-time jobs, or may be enrolled in college and living off-campus. (As discussed elsewhere in this report, off-campus college students and unrelated individuals have higher poverty rates as consequences of how income is calculated and poverty status determined.)

Poverty rates drop substantially with progressively older age groups. This reflects the converse of reasons offered above: there may be older, fewer or no children at home, which simultaneously lowers the poverty thresholds for families and enables more adults (and even older children) to earn more money; middle-age people work more and have higher incomes than young people. Appendix Table A12b summarizes age group figures supporting these explanations. On the other hand, those ages 75 and older are more likely to have lost a spouse – and, perhaps, some or all of any related income.

Perhaps the most unexpected characteristics in the chart above are the consistently low poverty rates for people ages 65 to 74 and 75 and over. These may be partially due to social security and pensions income growth pegged to inflation rates. These little- or no-changed poverty rates seem remarkable given the in-household population of the 75-plus group rose 17.8 percent from 1999 to 2016, and that of the 65-to-74 year-olds rose 35.7 percent (see Appendix Table A12a).

Earlier sections of this report noted how the poverty rates for those not working became much higher after people receiving social security and retirement income were removed from the work/marital/poverty status analyses. This section adds a note on the importance of retirement and social security income in reducing poverty rates for those ages 65-plus. Appendix Table A12a shows removing retirement income alone increases the poverty rate 8.1 to 43.7 percent; removing social security alone increases the rate to 54.2 percent, and removing both increases it to 61.8 percent (based on U.S. Bureau of the Census – ACS, 2017b). Fox (2017: Figure 8 and Appendix Tables A-6 & A-7) also demonstrates the impact of social security in reducing poverty rates for this age group.

See Tables A12a & A12b

Poverty Rates in Ohio, 2015-2016 by Age Group, Sex and Minority Status

Source: U.S. Census Bureau

AGE GROUPS, SEX AND MINORITY STATUS

The chart above extends the analysis of the preceding section by illustrating how the risk of poverty varies by sex and majority/minority status within each age group. While the overall life cycle pattern is still evident for each segment, additional points are readily apparent:

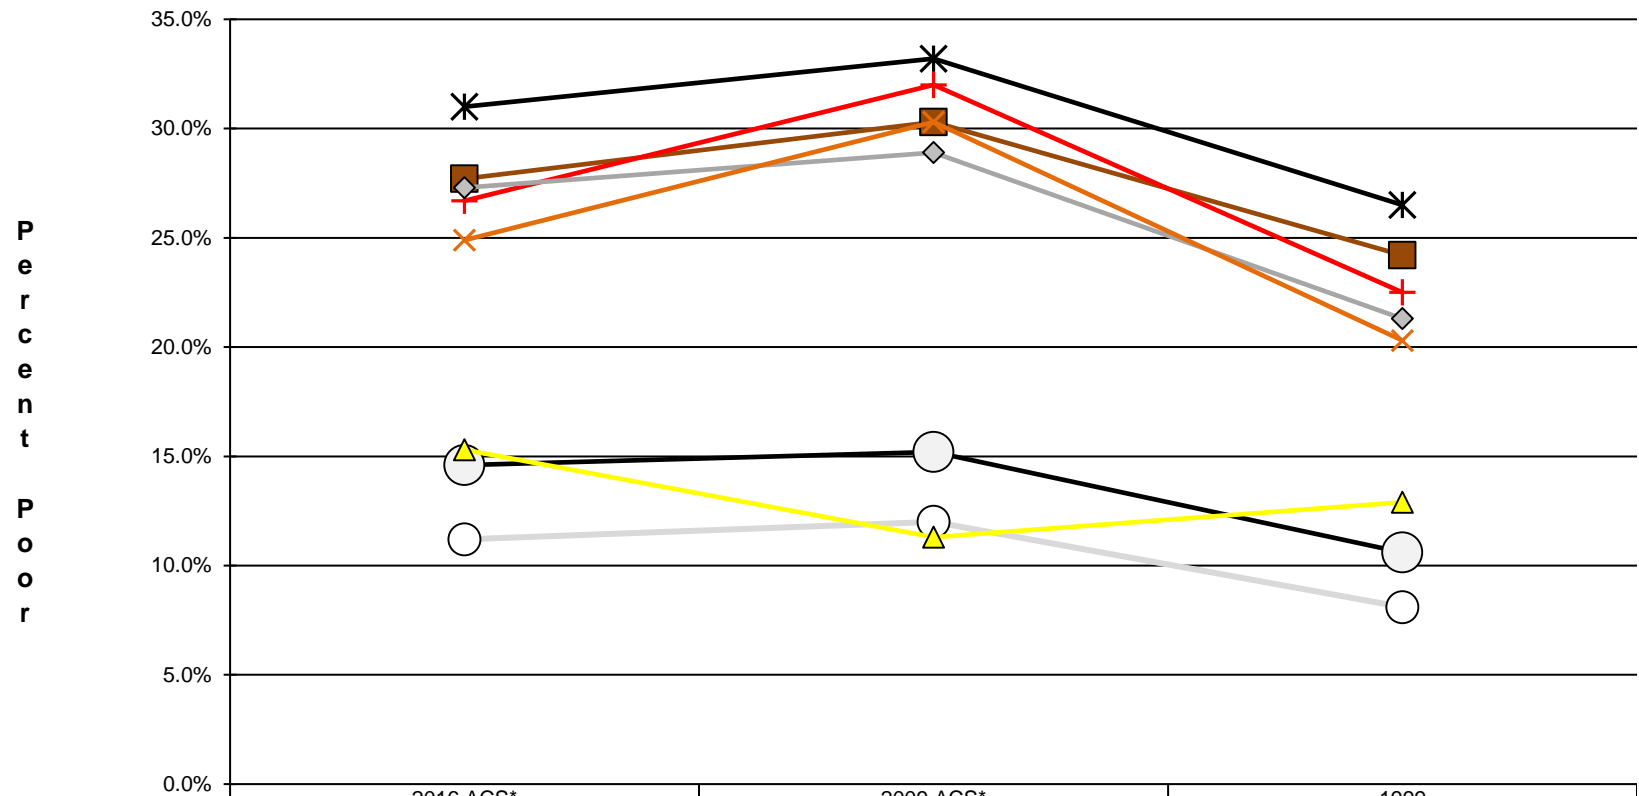

- At every age, poverty rates are much lower for the majority (non-Hispanic whites, pink dots and light blue squares for females and males, respectively) than for minorities (everyone else, red dots and dark blue squares for females and males, respectively), with the partial exception of majority females ages 75 and over.
- The poverty rates for minority children are much higher than for majority children, ranging between 26 and 43 percent compared with 11 to 17 percent; however, there is little or no difference between the sexes within the majority and minority segments (children are less than 18 years old), possibly excepting minority females ages 15 to 17.
- Higher poverty rates for women first appear in the 18-24 age group and remain in the 25-34 age group, but diminish to the point of insignificance in the 55-64 age group; however, more modest differences re-emerge thereafter.
- The declining poverty rates of children coincide with the declining poverty rates of persons 20 to 35 years older (i.e., roughly a generation older) – more so for women than for men.

The last two points seem consistent with the fact 67.1 percent of poor families with related children were headed by women with no husband present in 2016 in contrast with 12.0 percent of such families headed by males with no wife present (approximately 157,000 and 28,000, respectively, out of 234,000 – see Appendix Table A9). Married couples comprise the remaining number and percentage of poor families with related children – 49,000 and 20.9 percent.

See Tables A9 & A12c

Poverty Rates in Ohio, 1999-2016

by Race and Hispanic Identity

	2016 ACS*	2009 ACS*	1999
—○— Total	14.6%	15.2%	10.6%
—○— White, Not Hispanic	11.2%	12.0%	8.1%
—■— All Minorities Combined	27.7%	30.3%	24.2%
—*— Black	31.0%	33.2%	26.5%
—△— Asian/Pacific Islander	15.3%	11.3%	12.9%
—+— Amer. Indian/AK Native/Other^	26.7%	32.0%	22.5%
—◇— Bi/Multi-racial	27.3%	28.9%	21.3%
—x— Hispanics~	24.9%	30.3%	20.3%

Notes: * - ACS data cover January of the prior year through November of the listed year;
 ^ - Estimates shown separately in Appendix Table A13a; ~ - Hispanics may be of any race.

Source: U.S. Census Bureau

RACE AND HISPANIC DETAILS

The risk of poverty varies by race and Hispanic status.¹⁶ With the possible exception of Asians-and-Pacific Islanders (yellow triangles), the chart above shows poverty rates for all other segments rising from 1999 to 2008-2009 and showing little net change by 2015-2016. Non-Hispanic whites (white circles) – the majority segment in society – had the lowest poverty rates, ranging from 8.1 to 12.0 percent. These contrast with the overall poverty rate for minorities (brown squares), which rose from 24.2 to 30.3 percent before modestly declining to 27.7 percent. The overall minority poverty rate largely reflects the experience of blacks (black stars), and blacks had the highest poverty rates in this time period, ranging from 26.5 to 33.2 percent. Similarly, poverty rates for American Indians, Alaskan Natives or some Other race (red crosses – Appendix Table A13 show the rates separately) and those claiming more than one race (gray diamonds) rose from the low 20s to around 30 percent in 2008-2009 with modest apparent declines since. Asians and Pacific Islanders are at the other end of the minority spectrum with rates from 11.3 to 15.3 percent – much closer to the majority.¹⁷ The poverty rate for Hispanics (orange “Xs”), who may be of any race (but choose white most of the time), rose from 20.3 to 30.3 percent in 2008-2009 before decreasing to 24.9 percent in 2015-2016.

While minorities generally have higher poverty rates than the majority, most poor people in Ohio are non-Hispanic whites. The most recent American Community Survey estimated their numbers at 1,007,000 – 61.2 percent of the 1,645,000 total. Of the remaining 638,000 (minorities, 38.8 percent), blacks are the largest segment – 428,000 (26.0 percent), followed by Hispanics – about 102,000 (6.2 percent), bi- and multi-racial persons – 85,200 (5.2 percent), Asians and Pacific Islanders – 36,200 (2.2 percent), and American Indians and Alaskan Natives – 4,500 (0.3 percent). 28,400 persons identifying as some other race were 1.7 percent of the poor. (The individual minority components sum to more than the 638,000 and 38.8 percent because Hispanics may be of any race.)

See Table A13a

Distributions of Majority and Minority Populations in Ohio, Persons for Whom Poverty Status Determined and Poor, by Area Type, 2015-2016

Source: U.S. Census Bureau

THE DISTRIBUTION OF MAJORITY AND MINORITY POPULATIONS AND POVERTY

The chart above illustrates the differing distributions of majority and minority populations. The six columns on the left show the distributions of *all persons for whom poverty status was determined* (“all,” for short), and the six columns on the right show the distributions of *poor* people. Each is subdivided by the area of residence: central and principal cities of metropolitan areas (blue), other urban places (red dots), and rural (green). 58.2 percent of all non-Hispanic whites – the majority population – live in other urban areas, followed by 26.6 percent in rural areas and 15.2 percent in the central or principal cities of metropolitan areas. This contrasts with the distribution of all minorities, 95.8 percent of whom are urban with 50.3 percent in central or principal cities; only 4.2 percent lived in rural areas. In short, minorities are much more urban than the majority.

The distributions of *poor* majority and minority populations are similar. 52.5 percent of poor non-Hispanic whites are in other urban areas, with the remaining poor are roughly equally split between central and principal cities and rural areas – 24.9 vs. 22.6 percent. By contrast, 97.8 percent of poor minorities are urban, with 62.8 percent central and principal cities and 34.8 in other urban areas; only 2.4 percent are in rural areas. Like their total population, minority poor are much more urban than the majority poor.

Absolute numbers from Appendix Table A13b confirm the asymmetric distributions of poverty by area type: in central and principal cities, minority poor out-number majority poor by about 401,000 to 251,000. The composition is reversed elsewhere: in other urban areas majority poor out-number minority poor by about 529,000 to 222,000; and in rural areas majority poor out-number minority poor by about 228,000 to 15,000. In other words, the composition of the poverty population changes from mostly minorities to overwhelmingly non-Hispanic whites as one moves from big cities to the countryside – largely reflecting the urban residence of minorities for whom poverty status was determined.

Still, differences in poverty *rates* by area type are similar – they just are more than doubled for minorities overall, but with 34.6 vs. 18.4 percent in central and principal cities, 21.2 vs. 10.1 percent in other urban areas, and 15.7 vs. 9.5 percent in rural areas.

See Table A13b

This page intentionally blank.

APPENDICES

DEFINING AND MEASURING POVERTY

The definition of poverty originated in the Social Security Administration in 1964. It has been modified by Federal inter-agency committees since then, with the Office of Management and the Budget now prescribing it as the standard to be used by Federal agencies for statistical purposes. The Census Bureau notes:

“At the core of this definition was the 1961 economy food plan, the least costly of four nutritionally adequate food plans designed by the Department of Agriculture. It was determined from the Agriculture Department’s 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; hence, the poverty level for these families [*i.e.*, the minimum income required to avoid inadequate nutrition] was set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher to compensate for the relatively larger fixed expenses for these smaller households” (U.S. Bureau of the Census – DC, 1992: B-27).

A family consists of a householder and one or more other persons related by birth, marriage or adoption living in the same housing unit.¹⁸ Families (and all of the persons in them) with less than the minimum income required for the economy food plan are below the poverty threshold and are poor. Families (and all of the persons in them) at or above the minimum are not poor. The amounts of money needed to stay out of poverty vary by size and, for families of the same size, the number of related children under 18 years old. The threshold table for 2016 is reproduced below.¹⁹

The Minimum Family Income Needed in 2016 to Stay Out of Poverty, by Family Size and Number of Related Children

The Minimum Family Income Needed in 2016 to Stay Out of Poverty, by Family Size and Number of Related Children									
	Number of Related Children Under 18								
Size of Family Unit	0	1	2	3	4	5	6	7	8 or more
1 (unrelated individual):									
Under 65	\$12,486								
65 or older	\$11,511								
2: Householder Under 65	\$16,072	\$16,543							
65 or older	\$14,507	\$16,480							
3	\$18,774	\$19,318	\$19,337						
4	\$24,755	\$25,160	\$24,339	\$24,424					
5	\$29,854	\$30,288	\$29,360	\$28,643	\$28,205				
6	\$34,337	\$34,473	\$33,763	\$33,082	\$32,070	\$31,470

Source: U.S. Bureau of the Census.

Altogether, the Bureau uses 48 different family income levels to determine poverty status. Larger families and families with more adults require more money. Between the two criteria, size is far more important than the number of children in determining minimum income levels. Also note the lower income requirements of one- and two-person households/families with householders age 65-plus compared with similar households/families with younger householders. All poverty thresholds are updated each year with the Consumer Price Index data (specifically the CPI-U).

It is important to note how the Census Bureau calculates family income because it is at the core of determining poverty status. The Bureau collects information from every person in the family age 15 years and up regarding income sources. Sources include: wages, salaries, sales commissions, tips, piece-rate payments, bonuses, self-employment (farm and non-farm, net of expenses), interest, dividends, rents, royalties, trust fund payments, social security, retirement pensions or survivor benefits, disability benefits, unemployment compensation, Veterans Administration payments, alimony and child support, military family allotments, net gambling winnings, cash public assistance (including supplemental security), and regular, periodic payment from insurance policies, IRAs and KEOGH plans or a person outside of the family. The family's income is the sum of all money received from the above-mentioned sources by any family member – all before deductions for taxes, payments into retirement funds, union dues, bond purchases, Medicare, etc. (U.S. Bureau of the Census – DC, 1992).

Not included as income is money received from one-time or irregular transfers. Examples include gifts, inheritances, insurance payments, tax refunds, loans, bank withdrawals, exchanges of money between relatives in the same household, and capital gains or property sales (unless that was the recipient's business). Similarly, non-cash benefits and income-in-kind – food stamps, public housing subsidies, medical care, or employer contributions for persons – are excluded from income calculations (U.S. Bureau of the Census – DC, 1992, 2002).²⁰

The preceding discussion places poverty in a family context, but not everyone lives in a family. Individuals living by themselves are treated as families of one in the threshold table. Unrelated individuals living in the same housing unit (e.g., roommates) are treated as separate families, with poverty determinations done for each such person. The Bureau assumes unrelated individuals do not share their incomes with one another while family members do (Welniak, n.d.).

Therefore, poverty status is determined for all persons with a few exceptions: those who are institutionalized, in military group quarters or college dormitories, and unrelated individuals under 15 years old. Institutionalized persons and those in military group quarters or college dormitories are excluded because they receive adequate nutrition even though they may have little or no income. (Recall that dormitory residents are included via their families of orientation in calculations based on the Current Population Survey). Unrelated individuals under 15 years old usually are foster children, for whom some extra-familial financial support may be provided.

ALTERNATIVE MEASURES OF POVERTY

The Census Bureau's definition of poverty has been criticized on a variety of points, and the Bureau has done extensive research addressing the issues raised. The latest results of its efforts are discussed in "The Supplemental Poverty Measure: 2016" (Fox, 2017), which accounts for the impact of various changes made in response to those criticisms. Differences between the official and supplemental measures are highlighted as follows:

Issue	Official Poverty Measure*	Supplemental Poverty Measure
Measurement Units:	Families or unrelated individuals	Treats unrelated and foster children and co-habiting partners and relatives as families
Poverty Threshold:	Three times the cost of the minimum 1963 food diet	<i>Adds</i> clothing, shelter and utility expenses to food costs
Threshold Adjustments:	Varied by size, composition and the householder's age	Also adjusts for variations in housing costs by geographic region, metropolitan residence and tenure
Updating Thresholds:	Consumer Price Index (CPI-U)	Five-year moving averages of expenditures for food, clothing, shelter and utilities
Resource Measure:	Cash income before taxes	<i>Adds</i> tax credits and the value of non-cash^ benefits applying to food, clothing, shelter and utilities, then <i>subtracts</i> taxes, work and out-of-pocket medical expenses, and child support paid to another household

Notes: * - specifics are discussed elsewhere in this report; ^ - non-cash benefits come from programs such as Supplemental Nutrition Assistance (SNAP), National School Lunch, Supplementary Nutrition for Women, Infants, and Children (WIC), Low-Income Home Energy Assistance (LIHEAP) and housing assistance.

Using the Current Population Survey Annual Social and Economic Supplement (CPS-ASEC, still the official data source for national and state-level poverty statistics), Fox concluded the overall effect of changing to the supplemental measure raised the 2016 estimated U.S. poverty rate from 12.7 to 14.0 percent of all persons for whom poverty status was determined, a modest but significant increase. The effect was broadly based in some respects; rates were higher regardless of sex, nativity and educational attainment. The effect was more focused in other respects. The highest rate increase was among ages 65-plus. Other segments for whom rates rose were workers and working-age able-bodied adults, married couples, male-headed families, unrelated individuals, home owners, the uninsured and privately insured, and whites,

Asians and Hispanics. The steepest reduction was among unmarried partners. Rates also were lower for children, disabled working-age adults, and those with public insurance. Rates were unchanged for female-headed families, blacks, renters and working-age adults not working (Fox, 2017: Appendix Table A-2).

The impact of residential adjustments should not be underestimated. Midwestern and non-metropolitan residents had lower rates. Specifically, the three-year moving average (2014-2016) for Ohio fell 14.3 to 11.8 percent with the switch from the official to supplemental measures, a significant reduction. Nineteen other states also saw significant rate reductions, but 13 states and the District of Columbia saw significant rate increases while 17 states saw no significant change. Overall, the three-year moving average for the U.S. rose from 13.7 to 14.7 percent with the switch from the official to the supplemental measure (Fox, 2017: Appendix Tables A-2 & A-5).²¹

It should be mentioned that both official and supplemental measures are limited in assessing a family's ability to meet its needs when they consider only the family's income. Poverty measures ignore any wealth a family may have and use in meeting its needs. For example, a family may draw upon its savings to compensate for any short fall of income. However, this is a minor quibble. Data show that low-income households generally have fewer assets of any sort on which to draw if necessary (U.S. Bureau of the Census – Other, 2001: Table C).

A brief discussion of the low- and moderate-income statistics used by the U.S. Dept. of Housing and Urban Development for its programs also is warranted. They may resemble poverty statistics, but should not be interpreted as alternative poverty measures. The poverty thresholds determined by the Bureau concern minimum incomes necessary for adequate nutrition, given family size and composition. The low-moderate income thresholds determined by Housing and Urban Development are essentially modifications of local area median incomes for families of a given size. The local area is either a metropolitan statistical area (MSA) or a non-MSA county, and family sizes range from one through eight. Low-moderate income thresholds start with the median-family-income-by-family-size-for-local-area from the decennial census. New estimates of medians are developed for the current fiscal year using mathematical formulas on data from County Business Patterns and the Current Population Survey. (The former is a Census Bureau product; the latter is accessible via a link at the Bureau's website). Housing and Urban Development modifies the new estimates by multiplying them by 30, 50 and 80 percent – the first two are known as the “very low-income” and “low-income” limits. Consequently, any similarity between the three income limits and poverty thresholds is coincidental; in other instances, the income limits are far above or below the corresponding poverty thresholds.

1992*	12.9	7.4	\$33.077				

Notes: ^ Poverty rates from the decennial censuses; * - poverty rates are three-year moving averages mostly from the Current Population Surveys (CPSs), but also including data from adjacent decennial censuses (DC); poverty rates after 2000 are from the American Community Survey (ACS).

1 - Ohio's unemployment rates for 1959 and 1969 are from U.S. Bureau of the Census - DC (1973, table 46); otherwise from ODJFS/LMI (2018).

2 - Adjusted for inflation using CPI-U for Cleveland and Cincinnati, and standardized on 2016 (U.S. BEA, 2018; U.S. BLS, 2018).

3 - Data for hyphenated years are averages of the two component years from the original sources.

Sources: ODJFS/LMI, 2018; U.S. Bureau of the Census - ACS (2003-2017); U.S. Bureau of the Census - CPS (1971-1979, 1981-1989, 1991-1999, 2001); U.S. Bureau of the Census - DC (1973, 1975, 1983, 1993, 2002); U.S. Bureau of Labor Statistics (2018); and U.S. Bureau of Economic Analysis (2018).

Notes: ACS - American Community Survey; DC - Decennial Census; ACS estimates are from sample data collected from January 2012 through December 2016 and January 2007 through December 2011; DC sample data were collected in April 2000, and refer to calendar year 1999; ACS estimates use family income of the 12 months preceding the month in which the data were collected, and have been adjusted for inflation; single-person households and unrelated adults with no children are considered one-person families; # - the odds are less than one in 20 that the percentage change from the earlier time occurred by sampling variability alone - i.e., the change *appears* real; ^ - significance testing would be unreliable; * - an Appalachian county.

Notes: ACS - American Community Survey; DC - Decennial Census; ACS estimates are from sample data collected from January 2012 through December 2016 and January 2007 through December 2011; DC sample data were collected in April 2000, and refer to calendar year 1999; ACS estimates use family income of the 12 months preceding the month in which the data were collected, and have been adjusted for inflation; single-person households and unrelated adults with no children are considered one-person families; # - the odds are less than one in 20 that the percentage change from the earlier time occurred by sampling variability alone - i.e., the change *appears* real; * - a central or principal city of a metropolitan area.

Percent Poor	41.1%	40.5%	77.5%	17.4%

Notes: * - "'16 ACSSF" is a repeat of the first data column in table A8a - table B17016 from the 2016 American Com-
munity Survey Summary Files; "'16 PUMS" conceptually matches "'16 ACSSF," but is drawn from the 2016
ACS Public Use Microdata Sample; "PUMS-XRS" is a subset of "'16 PUMS" eXcluding families with either Re-
tirement or Social security income; "PUMS-RS" estimates families with either Retirement or Social security in-
come; figures are obtained by subtracting "PUMS-XRS" from "'16 PUMS."

NOTES

- 1 Poverty status is determined for all people except those in institutions, military group quarters or college dormitories, and unrelated individuals under 15 years old (children who are not related family members – typically foster children). The 2016 American Community Survey data were collected throughout 2016, and income data, from which poverty statistics are derived, refer to the 12 months prior to the month in which the survey was completed. Consequently, the time period covered by the Survey for income and poverty extends from January 2015 through November 2016. Release of datasets with 2016 Survey results began in the last quarter of 2017.
- 2 Numbers and percentages throughout the report frequently are rounded to avoid the impression of greater precision than warranted. Following the procedure recommended by the U.S. Bureau of the Census – Other (2002), all of the estimates for Ohio based on the Current Population Survey (CPS) data are three-year moving averages. That means that the estimates of poor in Ohio for any non-decennial census year are based not only on the Survey for that year, but on the data covering the preceding and following years as well. For example, the estimates for 1990 are based on data gathered for the years 1989 (from the decennial census) through 1991, and the estimates for 1991 are based on data gathered for the years 1990 through 1992. This procedure produces more reliable estimates – particularly percentages – because the sample sizes are larger. It also reduces the erratic changes seen when only one year of data is used. However, what is gained in reliability is lost in specificity; a three-year moving average for 1991, for example, refers to a three-year period centered on 1991. Furthermore, while CPS calculations exclude unrelated children under 15 years old and many group quarters residents, it – unlike the decennial census – counts college students in dorms as parts of their families of orientation, and therefore as persons for whom poverty status is determined. There is nothing that can be done to change this and its reduction of comparability with estimates from other Census Bureau programs. Fortunately, the effect is small.
- 3 This assumption is not always correct. Even when it is, unrelated persons sharing a housing unit (e.g., roommates) may split expenses such as utilities and rent, permitting more of their income(s) to be devoted to food and avoiding inadequate nutrition, which is at the core of the definition of poverty (see the Appendices section on Defining and Measuring Poverty).
- 4 The five-year dataset is the most recent covering areas of all sizes. The estimates are averages for the period, analogous to long-exposure photos, as opposed to the 2000 census “snap shot” seen elsewhere.
- 5 The high poverty rate in Athens County is partially explained by the large portion of the population comprised of students living off-campus. Students often rely on various combinations of familial support, irregular gifts, savings,

loans, grants and scholarships – which may or may not count as income – to meet expenses.

- 6 Significant changes from 2007-11 in some larger counties rely on the greater confidence in larger sample sizes producing more reliable estimates, but changes – or lack thereof – also may be due to random sampling variability.
- 7 Model based estimates are based on mathematical formulas, incorporating data from the most recent surveys. Such estimates are highly reliable for large areas like states and the nation, but are much less so for small sub-state areas. The reader should be cautious with the SAIPE percentages and numbers in tables A5a and A5b. The narrow ranges for 2000-2004 may reflect a greater reliance on the Current Population Survey data, a labor force survey whose state-level data are more-or-less reliable, while ranges after 2004 probably include county-level data from the American Community Surveys, which are more representative of the general population and also are much larger and more reliable samples.
- 8 Several things need to be remembered when comparing the 2000 census data with American Community Survey data. First, metropolitan areas often were redefined as a result of the 2000 census, which means specific geographic areas may not be exactly the same. (This is certainly true for the summary figures.) The same may be true of the urban/rural dichotomy and one or more places listed in the Appendix Tables. Second, the validity of testing for significant changes in poverty rates is questionable to the extent that the geographic areas differ – but this is seldom a big problem. Finally, the urban/rural and metropolitan/non-metropolitan dichotomies are not identical because urban places and rural areas are located in both metropolitan and non-metropolitan areas.
- 9 Similar to Athens County, the cities of Athens, Bowling Green, Kent and Oxford are small college towns in which off-campus students comprise relatively large portions of the populations. Off-campus students not living with their families of orientation frequently qualify as poor because some money they may receive is not counted as income by the Census Bureau, driving the communities' person poverty rates to higher levels. In this circumstance, a place's family poverty rate may be a more useful measure of the extent of poverty because students are less likely to be married. Indeed, the family poverty rates of Athens, Bowling Green, Kent and Oxford – 26.4, 15.4, 24.9 and 11.7 percent, respectively – are more-or-less closer to the state's family poverty rate of 11.2 percent than are the corresponding poverty rates for persons (U.S. Bureau of the Census – ACS, 2017c).
- 10 More extensive ratio-of-income-to-poverty-level categories for persons and families are found in other tables from the American Community Survey summary files. However, such categories are few for households. (There are two types of households: families and non-family households; families are the more common type.) It also is possible to calculate other ratios of income to poverty level for customized research using the Public Use Microdata

Samples (PUMS): Ratio = Income / Poverty Threshold. As noted elsewhere, the poor have a ratio value less than 1.00; those at or above 1.00 are not poor.

- 11 Among those working at least 35 hours per week and 50 weeks in the preceding 12 months (i.e., full-time/year-round), women in every age group from under 20 to 70-plus generally earn less money than comparable men (U.S. Bureau of the Census – ACS, 2017b); reasons why are beyond the scope of this report.
- 12 See the U.S. Bureau of the Census – ACS (2017c: table B23003).
- 13 For people working at least 35 hours per week and 50 weeks in the preceding year, median earnings (wage and salary plus self-employment income) reach a plateau no later than their 40s and remain there through their 60s; mean earnings (the arithmetic averages) exceed medians (which divide distributions in half) by at least 20 percent beginning in people’s 30s (U.S. Bureau of the Census – ACS, 2017b).
- 14 These data points may be artifacts of the Census Bureau’s methodology. Members of family households are assumed to share the income of all members, while members of non-family households are not. Consequently, the poverty rate of non-family households is really the poverty rate of the householder, regardless of how many other people may live in the household and what their incomes may be. As mentioned earlier, unrelated people may have roommates to reduce housing-related expenses, thereby leaving larger portions of their incomes for food, other expenditures and/or savings. See the section on Alternative Measures of Poverty in the Appendices for the impact changing this assumption has on the risk of poverty.
- 15 Cash public assistance (CPA) includes payments received from various programs such as aid to families with dependent children (AFDC), temporary assistance to needy families (TANF) and general assistance (GA). It also includes supplemental security income (SSI) payments made to low income persons who are at least 65 years old, blind or otherwise disabled. Payments received for medical care are excluded (U.S. Bureau of the Census – DC, 1992).
- 16 Race and Hispanic status are based on self-identification. “Hispanic” is an ethnic status, and Hispanics may be of any race. Bi- and multi-racial categories were used for the first time in the 2000 Census. While only a small percentage of people identify themselves as such, the addition of this category means that the racial categories of 2000 and later are not entirely comparable with those of previous censuses. Similarly, data on Hispanics may not be entirely comparable over time due to slight differences in the ways the questions were asked during different censuses (U.S. Bureau of the Census – DC, 2002: Appendix B).

- 17 American Indian and Alaskan Native poverty rates are similar to Other rates; they are combined for ease of presentation in the graph, but shown separately in Appendix Table A13a. Asian/Pacific Islander figures often are shown separately in national statistics, but are combined here because reliable figures solely for Pacific Islanders in Ohio are not available.
- 18 The householder is the person in whose name the occupied housing unit is owned or rented. Persons related to one another by birth, marriage or adoption – but living with a householder to whom they are *not* related – comprise (specifically) an unrelated subfamily. Separate poverty status calculations are made for each for official poverty statistics (U.S. Bureau of the Census – DC, 1992), but an alternative measure of poverty would not. See the Alternative Measures of Poverty section and Fox (2017) for the impact of this change on poverty rates.
- 19 *Thresholds* for prior years are available at the Census Bureau’s website. The current poverty *guidelines* used for program eligibility determination are available at the U.S. Dept. of Health and Human Services’ website.
- 20 This definition of income has much in common with those used by the Internal Revenue Service and the Bureau of Economic Analysis, but it is not identical with the definitions used by the latter two. Consequently, area statistics produced by the latter may strongly correlate with poverty statistics, but do not substitute for them.
- 21 Ohio’s lower supplemental poverty rate is consistent with U.S. BEA (2018) data showing Ohio’s 2015 per capita personal income above the U.S. average after adjusting inflation and regional price differences.
